What is a homely remedy?

There are many times at which a resident may develop a minor ailment that needs to be treated. It is important that staff are able to respond in a timely way and help the resident to feel well. Many people living in their own home purchase remedies from the chemist or the local shop and generally do this without involving the GP. Pharmacists will also provide advice on the best treatment and give advice on its use.

For people living in a care setting, which is their own home, we now refer to this approach as using homely remedies. A homely remedy is a medicinal preparation used to treat minor ailments; it is purchased over the counter and does not require a prescription. These homely remedy products are kept in the home to allow access to products that would commonly be available in any household.

Homely remedies fall into two legal categories, GSL (general sales list), which are available widely and sometimes referred to as over the counter medicines or pharmacy (P) medicines which are available only from a pharmacy. Medicines falling into these categories may be prescribed for service users at the discretion of the resident’s GP. Any such medicines, which are obtained on prescription, must only be administered to the individual specified on the container label. They are not to be used as a source of stock for the household remedy cupboard.

It is good practice on admission to discuss health needs and medicines with the resident and their family. This should also include the use of homely remedies. Residents and their families should always be involved in these discussions and the resident’s consent should always be sought. If a person lacks capacity to make decisions then the decisions may be made by the family or at a best interest meeting.

It is advised that the manager discuss the use of homely remedies with the resident’s own GP. An agreement is made on the particular medicines and the length of time they can be given without recourse back to the GP.

Residents or relatives may bring in their own homely remedies which have been approved by their own GP. These are not for general use in the home and must remain specific to that resident. They should be counted into the home and administered and recorded in the same way as all other medication on a mar sheet.

A GP may instruct the home staff to purchase a specific product to treat a minor ailment for a particular resident, such as olive oil for treatment of ear wax. This is no different to a person treating themselves in their own home and can be actioned, provided the instructions are written by the GP in the individual care plan (or faxed) and only apply to the individual named.
Why stock homely remedies?

The Care Quality Commission agrees that a small range of products may be kept in stock in a care home for residents for the treatment of minor ailments. Homes who agree to stock such products must develop their own policies with an approved list of products and minor ailments which will be treated in this way.

Staff need to be able to respond quickly to symptoms of a minor nature, such as toothache or headache. This guidance is intended to help in such situations.

Recommendations

- Only stock purchased by the care home for administration under the homely remedies policy may be used.
- Only the named preparations listed in the policy may be administered without a prescription.
- Products labelled for a particular resident (i.e., for whom a prescription has been issued), brought in by the resident or recommended solely for a particular resident must not be given to another service user as a homely remedy.
- All administered doses of homely remedies must be recorded and indicated as a homely remedy on the mar sheet and other medication recording documents in accordance with the medicines policy in the home.

At times residents may develop a minor ailment which in their own home would be easily treatable by accessing a local pharmacy for an OTC product. If a resident does not have a suitable remedy on their normal prescription the staff may feel that the only course of action is to call the GP or the out of hours service. This may be for something like a headache. By having homely remedies in the home, an immediate need can be met and the GP is only called if the symptoms persist.

Discussions and agreement with the GP about the use of homely remedies is essential. The pharmacist will also provide necessary advice. It is generally advised that homely remedies should only be used for 48 hours and then a referral to the GP will need to be made.
Managing homely remedies

Administration

This guidance helps to clarify the actions required by the senior staff of the home who are responsible for the administration of medicines. All staff must recognise and act within the parameters of safe practice. Professional accountability for updating knowledge of homely remedies will lie with the lead person for the management of medication within the home; this is usually the manager, deputy or lead nurse.

The manager is responsible for ensuring that appropriate training and support is made available to all staff involved in the administration of medicines.

Storage

Homely remedies should be stored in the same location as all other medication but designated clearly to show they are not resident specific.

The contents of the homely remedies cupboard should be date checked at least every six months. The date of opening should be marked on liquid medicines which should then be replaced as advised by the manufacturer.

Process

The use of homely remedies for the minor ailments named in this document is supported by a flow chart decision aid and it enables staff to use stocked medication appropriately.

Homes, individual residents or families may need to purchase the homely remedy.

If the staff are unsure if a homely remedy is suitable, they must seek the advice of the doctor or pharmacist before use.

The flow charts included in this document provide a decision making tool for some specific minor ailments.

When using the flow charts the carer/nurse must ascertain:

- that the resident has no potentially serious symptoms
- past medical and drug history
- any known allergies
- what the resident has used in the past for these particular symptoms
- that the resident consents and is aware that the medicine is not prescribed, but it has been agreed with the GP
- that the homely remedy medicine will be used for up to 48 hours only

The carer/nurse will regularly review and reassess the resident’s response to the medication. Further doses can be administered in accordance within the medicinal products GSL or P licence guidelines, for a maximum of 48 hours. If the symptoms persist then a referral should be made to the GP.

Record keeping

The carer/nurse will record details of the assessment, homely remedy administered and outcome in the resident's care plans and the mar sheet.

Monitor the usage of all homely remedies.

Adverse reaction

In the rare event of any adverse reactions, the GP must be informed immediately.

The yellow card adverse drug reaction reporting scheme is a voluntary scheme through which doctors notify suspected adverse reactions to medicines. It is for the GP to decide, following discussions with the senior staff/nurse, whether to submit a yellow card to the Medicines Control Agency/Committee on Safety of Medicines.

In the event of a serious life threatening adverse reaction the nurse/carer will carry out emergency treatment and refer the resident direct to the accident and emergency department.
Flow charts relating to the following symptoms are provided below.

These charts should be used in conjunction with the homely remedies toolkit.

**Chart 1**

**Guidance for treatment of minor ailments with household remedies - INDIGESTION/HEARTBURN**

Indigestion is experienced as discomfort, or a burning pain in the central chest region. When this burning rises up towards the throat it is referred to as heartburn. Flow chart for use when resident has mild pain only. All cases of acute or severe pain must be referred immediately.

**Is there any doubt that the symptoms are caused by indigestion or is the service user generally unwell?**
- **YES** → Contact GP or NHS Direct.
- **NO** → Is the resident taking any medication which may cause indigestion? Check information leaflets and see box 1.
  - **YES** → Contact pharmacist or GP and follow advice. Record.
  - **NO** → Is the resident taking any medication which carries a warning to avoid antacids or indigestion remedies? (check label)
    - **YES** → Contact pharmacist for advice or avoid giving indigestion medicine within two hours either side of affected medication.
    - **NO** → Do symptoms involve burning sensation rising up towards throat?
      - **YES** → Give Gaviscon Advance* after meals and at bedtime. Give lifestyle advice (see box 2).
      - **NO** → Give simple indigestion mixture* (Mucogel) and lifestyle advice (see box 2).

**Treatment box 1**

Some medicines that commonly cause indigestion:
- Anti-inflammatory medicines, eg aspirin, ibuprofen, diclofenac, naproxen
- Oral corticosteroids, eg prednisolone

**Treatment box 2: Lifestyle advice**
- Cut down or stop smoking, alcohol, caffeine (contained in coffee, cola drinks, tea and some pain killers) if possible
- Avoid spicy foods, eg curries
- Avoid clothing which is tight around the waist
- Eat small regular meals, chew food well
- Avoid bending or stooping during and after meals

* Homely remedy - Remember that treatment with household remedies must be recorded on the MAR chart and must be for NO MORE THAN 48 hours without contacting the service user’s GP. Ensure the next shift is informed about any household remedies that have been given.

Chart 2

Guidance for treatment of minor ailments with household remedies - PAIN such as headache

Flow chart for use when service user has mild pain only. All cases of sudden onset severe pain must be referred.

Has resident been given any medication containing paracetamol during last 24 hours?

Remember that paracetamol is an ingredient of medicines such as co-codamol (includes Kapake, Solpadol, Zapain and Remedeine) co-dydramol, co-proxamol as well as many products purchased over the counter such as cough and cold remedies (check labels carefully). Don’t forget to check liquid medicines.

Paracetamol* may be given provided that the maximum dose in 24 hours is not exceeded and that it is at least four hours since the last dose.

Can patient swallow tablets?

Give paracetamol suspension 250mg/5ml* For adults give 20ml per dose and repeat if necessary every four to six hours. Not more than 80ml (4 grams) must be taken in 24 hours.

Give Paracetamol* tablets/caplets 500mg. For adults give two tablets per dose and repeat if necessary every four to six hours.

No more than eight tablets must be taken in 24 hours.

Communication of pain is not just verbal. Look for facial signs, sighing, groaning, calling out, aggression and withdrawal which is out of character.

* Homely remedy. Available to purchase as tablets, capsules, caplets and liquid.

Remember that treatment with household remedies must be recorded on the MAR chart and must be for NO MORE THAN 48 hours without contacting the service user’s GP. Ensure the next shift is informed about any household remedies that have been given.

Chart 3
Guidance for treatment of minor ailments with household remedies - COUGH

Flow chart for onset of cough. Antibiotic treatment is not indicated for the majority of otherwise well patients with coughs.

Is the resident over 65 with two or more of the following?
• Type 1 or 2 diabetic
• History of heart failure
• Currently taking prednisolone
• Has been in hospital for chest problems in last 12 months

Contact GP or NHS Direct

Does the resident have any other symptoms such as shortness of breath, chest pain, wheeziness or seem generally unwell?

Check medication with pharmacist to eliminate possible side effects.
Give simple linctus or Pavacol D / sugar free simple linctus for diabetics*.

Does the resident have asthma or chronic obstructive pulmonary disease?

Give plenty of fluids. Watch and wait. Monitor daily for signs of deterioration—in which case follow arrow.

Is cough dry and irritating?

Call GP or NHS Direct

Is phlegm clear white or pale yellow?

UNWELL

Is phlegm copious, dark coloured, bloodstained and unpleasant?

Contact GP or NHS Direct

* Homely remedy

Remember that treatment with household remedies must be recorded on the MAR chart and must be for NO MORE THAN 48 hours without contacting the service user’s GP. Ensure the next shift is informed about any household remedies that have been given.

Chart 4

**Guidance for treatment of minor ailments with household remedies - CONSTIPATION**

Initial changes in bowel habits should be reported to GP. Bowel charts should be kept in care plans for monitoring purposes. Constipation in the elderly is often due to insufficient fluid intake so large glasses of fluid should be avoided. Little and often is more effective.

Information

Some common drugs which can cause constipation:
- Indigestion remedies containing Aluminium
- Antidiarrhoeals eg loperamide (Imodium)
- Antihistamines eg chlorphenamine (Piriton), promethazine (Phenergan)
- Antipsychotics
- Cough suppressants eg codeine and pholcodine
- Diuretics eg bendroflumethiazide, furosemide (if dehydration occurs)
- Iron and calcium supplements
- Pain killers containing opiates eg codeine, dihydrocodeine, morphine, tramadol
- Some antidepressants eg amitriptyline, dosulepin, imipramine
- Some Parkinson’s drugs eg levodopa
- Some drugs to treat high blood pressure

* Homely remedy

Remember that treatment with household remedies must be recorded on the MAR chart and must be for NO MORE THAN 48 hours without contacting the service user’s GP. Ensure the next shift is informed about any household remedies that have been given.

Chart 5
Guidance for treatment of minor ailments with household remedies - DIARRHOEA

Diarrhoea in the frail elderly can quickly lead to dehydration and deterioration in health.

Are any of the following present?
- Blood or mucus in stools
- A recent history of constipation
- The diarrhoea is accompanied by vomiting lasting more than 24 hours
- The stools are black and tarry or profuse and foul smelling
- Severe abdominal pain
- Drowsiness
- Confusion

YES
Contact GP or NHS Direct

Prolonged diarrhoea can reduce the effectiveness of medication and can de-stabilise patients such as diabetics and epileptics. Monitor more closely.

NO

Is the resident taking any medication which could cause diarrhoea? Common culprits are antibiotics (current or very recent) and laxatives!

YES

Continue fluids and if diarrhoea is severe it may be useful to offer rehydration solutions* (eg Dioralyte) to drink. Such solutions should be prepared following leaflet instructions and drunk within one hour (stored in a refrigerator may be kept for up to 24 hours).

UNSURE

Continue fluids and if diarrhoea is severe it may be useful to offer rehydration solutions* (eg Dioralyte) to drink. Such solutions should be prepared following leaflet instructions and drunk within one hour (stored in a refrigerator may be kept for up to 24 hours).

NO

Is the resident accepting fluids?

YES

Continue fluids and if diarrhoea is severe it may be useful to offer rehydration solutions* (eg Dioralyte) to drink. Such solutions should be prepared following leaflet instructions and drunk within one hour (stored in a refrigerator may be kept for up to 24 hours).

NO

Give loperamide* for 24 hours only as instructed in patient leaflet and continue to encourage to drink clear, non-milky fluids such as water or diluted squash little and often. Avoid dairy products such as milk or cheese. Foods suitable to eat include bananas, plain boiled rice, stewed apples and toast.

REFUSAL FOR MORE THAN 24 HOURS
Contact GP or NHS Direct

Infection control
Staff and residents must exercise rigorous hand hygiene as diarrhoea can spread through hand - surface contact to other residents. Seek medical advice if more than one case occurs as this could indicate a serious cause, eg C. difficile.

* Homely remedy

Remember that treatment with household remedies must be recorded on the MAR chart and must be for NO MORE THAN 48 hours without contacting the service user’s GP. Ensure the next shift is informed about any household remedies that have been given.

Chart 6

**Guidance for treatment of minor ailments with household remedies - MINOR SKIN PROBLEMS**

The cause of a rash is often very difficult to identify and can be associated with bacterial or viral infections. Life threatening rashes are accompanied by systemic symptoms where the patient is clearly unwell but for minor skin problems there is rarely a need for immediate referral.

| Disposable gloves must be used when applying any skin preparations. Dispose of gloves immediately after use and before treating another resident. Pump devices or tubes of ointments or creams are preferable to jars as they reduce risk of contamination and degradation of product. Always use a separate tube/jar for each resident. Never share. |
| Dry skin |
Dry skin often occurs in the elderly and can lead to problems (especially of the feet) if left untreated. An emollient such as E45* or Doublebase* can be tried. For continued need it can be prescribed. White soft paraffin*(Vaseline) is useful for dry lips. Dry, itchy scalps can be treated by rubbing olive oil* into scalp, leaving overnight and washing hair as normal. |
| Incontinence rash |
Cavilon* cream is recommended as a barrier cream. Sudocrem is not suitable for padded patients as it makes the pad ineffective. |
| Sweat rash |
Commonly occurs under breasts and in groin. Keep dry and if it becomes sore and inflamed contact GP. |
| Pressure areas |
Any sign of development of a pressure area must be referred to GP or district nurse without delay as it can rapidly deteriorate. |
| Insect bites and stings |
Bites and stings can be treated with calamine lotion* or cream*. A pain killing spray such as Wasp-Eze* may be useful especially on outings. Persons known to be allergic to wasp or bee stings must keep their emergency treatment with them at all times. If skin is unbroken and there is localised redness and itching, hydrocortisone 1% cream* can be applied. Severe swelling and redness must be referred to GP or NHS Direct. |

* Homely remedy

Remember that treatment with household remedies must be recorded on the MAR chart and must be for NO MORE THAN 48 hours without contacting the service user’s GP. Ensure the next shift is informed about any household remedies that have been given.
Emollients – can be used to soothe the skin, reduce irritation, prevent skin from drying and may be directly applied to skin or added to bathwater. E45 cream and Doublebase are the named emollients but there are many others and resident preference and tolerance is important. As a homely remedy the emollient should be used as a trial to address an immediate need but continued use should be prescribed. For homely remedy use, purchase small tubes and when opened only use for the individual resident. Olive oil and Vaseline (white soft paraffin) are readily available OTC products.

Incontinence rash - Cavilon cream. No creams or powders should be used on residents who may at times be incontinent as this affects the absorbency of the incontinence pads. Residents with red excoriated skin should have their urine tested to exclude urinary tract infection. Residents should be washed with non perfumed soap, dried and pad applied. Small amounts of barrier cream can be used if excoriation continues but should be reviewed. Barrier creams do not prevent pressure sores, if redness is due to pressure, pressure assessment needs to be completed. Cavilon cream® is recommended for those residents who are faecally incontinent, as it can be applied every 12 hours and skin washed in between.

Insect bites and stings - a homely remedy treatment is used to soothe the associated irritation and itching. Complications of bites are allergic reactions, infection and cellulitis. These would need immediate referral. Look for excessive swelling and widespread hotness and redness. Calamine lotion and aqueous cream are unbranded OTC products which soothe by cooling.

<table>

Notes
Improving medication management in care homes is a systemwide issue, which needs to be tackled by many different groups working together. This work is now being taken forward in an integrated programme led by the National Care Forum, funded by the Department of Health, working as part of a wider cross-sector partnership. This partnership involves:

- Age UK
- English Community Care Association
- National Care Forum
- Royal College of General Practitioners
- Royal College of Physicians
- Royal Pharmaceutical Society
- Care Provider Alliance
- National Care Association
- Registered Nursing Home Association
- Royal College of Nursing
- Royal College of Psychiatrists
- Royal College of Psychiatrists
- The Health Foundation
