

SHARED CARE GUIDELINE

Drug: Sulfasalazine

Introduction	Indications: Licensed: Rheumatoid arthritis, ulcerative colitis, Crohn's disease in adults and children Unlicensed: Sero-negative spondyloarthropathy including psoriatic arthritis and psoriasis. Background: Following oral administration around 90% of a dose reaches the colon where bacteria split the drug into sulfapyridine and 5-aminosalicylic acid (mesalazine). Overall the drug and its metabolites exert immunomodulatory effects, antibacterial effects, effects on the arachidonic acid cascade and alteration of activity of certain enzymes.
	Definitions: Stable dose – the dose will be titrated to achieve efficacy at the lowest dose. Once efficacy achieved and provided the patient can tolerate the dose, this will be termed "stable dose" Stable bloods – results of blood tests remain below the "alert" thresholds as set by national guidelines and have stayed at similar levels for at least two consecutive tests. N.B. The patient can continue to have active disease despite being on a stable dose or having stable bloods, so the "patient" is not referred to as "stable"
Form	Tablets EN: 500mg ² Only this preparation is licensed for rheumatoid arthritis Tablets 500mg ³ Liquid: 250mg/5ml ⁴ Suppositories 500mg ⁵
Dose & Administration	A typical dose regimen for rheumatoid arthritis is 500mg daily increasing by 500mg daily at weekly intervals to a maximum of 2-3 grams/day in divided doses. Occasionally doses above 3 grams/day are prescribed. Clinical response cannot be expected before 3 months. Treatment of acute attacks of ulcerative colitis/active Crohn's disease is 1-2g four times a day until remission achieved. Maintenance of remission reduce dose gradually to 500mg four times a day Night time interval between doses should not exceed 8 hours

Secondary Care Confirm the diagnosis. Responsibilities Discuss the benefits and side effects of treatment with the patient. Ensure that the patient understands which warning signs and symptoms to report. Advise patient on appropriate fluid intake Perform pre-treatment screening: FBC, LFT, U&E's and, creatinine/ eGFR Ensure that the patient understands not to expect improvement from the treatment straight away. Provide the patient with a monitoring and dosage record booklet and ensure that the patient knows when and where to attend for monitoring. Encourage the patient to take responsibility for ensuring that results of tests are entered in the monitoring booklet. Make arrangements for shared care with the patient's GP. Review the patient regularly to monitor the patient's response to therapy. Advise the GP on management of any dose adjustments and when to stop treatment. Ensure that clear backup arrangements exist for GPs to obtain advice. **Primary Care** Provide the patient with prescriptions for sulfasalazine; ensure EN tablets for rheumatoid arthritis. Responsibilities Ensure that the patient understands their treatment and which warning symptoms to report (see adverse effects below). Monitor at the recommended frequencies (see MONITORING below) and ensure that test results are recorded in the monitoring booklet. Report any adverse events to the consultant or specialist nurse and stop treatment on their advice or immediately if an urgent need arises (see MONITORING below). Report any worsening of control of the condition to the consultant or the specialist nurse. Follow recommended immunisation programme. **Immunisations** In patients exposed to chicken pox or shingles, if required, passive immunisation should be considered for varicella. Refer to Green book: Varicella: the green book, chapter 34 - Publications -GOV.UK **Common Drug** Sulfasalazine possibly reduces absorption of digoxin. Interactions Bone marrow suppression and leucopenia have been reported when sulfasalazine given with azathioprine or mercaptopurine. This list is not exhaustive, please refer to SPCs and BNF **Cautions** Glucose-6-phosphate dehydrogenase deficiency: May cause haemolysis. Renal impairment (moderate): Risk of toxicity including crystalluria, ensure high fluid intake. Pregnancy: Sulfasalazine is not known to have any teratogenic effects. The dose should not exceed 2grams per day and folic acid should be prescribed to those trying to conceive and during pregnancy. Breastfeeding: Small amounts of sulfasalazine and sulfapyridine are found in milk. Breastfeeding should be avoided. Severe infections - temporarily stop treatment **Contra-indications** Hypersensitivity to sulfasalazine, sulfonamides or salicylates. Porphyria. Severe renal failure

This guidance does not replace the SPC's, which should be read in conjunction with this guidance.

Monitoring and Adverse Effects

Treatment status	FBC	LFT	U+E Creatinine/eGFR	ESR or CRP
Initial monitoring in first 3 months	Every month	Every month	Every month	Every 3 months (for RA only)
After 3 months	Every 3 months	Every 3 months	Every 3 months	rva only)

If, following the first year, dose and blood results have been stable, frequency of monitoring can be reduced to every 6 months for the second year. Thereafter repeat monitoring once a year.

- Repeat FBC and LFTs one month after a dose increase.
- MCV > 105fL Check thyroid function, B12 and folate. Treat any underlying abnormality. If results normal discuss with specialist team.

In the event of the following adverse laboratory results or patient reported symptoms, withhold sulfasalazine until discussed with specialist team:

WCC < 3.5 x 10⁹/L or less than the lower limit of reference range as per lab
 Neutrophils < 2.0 x 10⁹/L or less than the lower limit of reference range as per lab
 Platelets < 150 x 10⁹/L or less than the lower limit of reference range as per lab

AST/ALT > 2 times the upper limit of reference range
 Albumin unexplained fall (in absence of active disease)

• Abnormal bruising or severe sore throat. Check FBC immediately.

· Rash or oral ulceration

Other adverse effects:

- Nausea/dizziness/headache. If possible continue, may have to reduce dose or stop if symptoms severe. Discuss with specialist team.
- Loss of appetite, raised temperature, leucopenia, hypoglycaemia, insomnia, taste distortion, tinnitus, cough, pruritus, arthralgia, proteinuria are all relatively common
- · Impaired folate absorption
- Oligospermia (reversible on discontinuing sulfasalazine) This list is not exhaustive, please refer to SPCs and BNF
