

# Cumbria COPD Treatment Guide

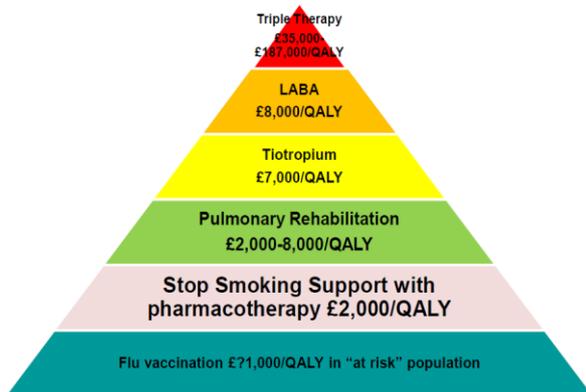

- Diagnosis depends on clinical history and quality assured spirometry
- Monitor and coach inhaler technique at each visit and before treatment progression
- Monitor saturation: refer on if SaO<sub>2</sub> <92% at rest or de-saturation on exercise
- Screen for anxiety and depression e.g. Hospital Anxiety & Depression (HAD) score (if ≥ 8 consider CBT)

**\*Spirometry:** Spirometers need to be maintained and calibrated regularly to ensure accuracy and tests must be carried out by trained professionals.

**\*\*A diagnosis of COPD requires demonstration of airflow obstruction with FEV1/FVC ratio <0.7 (or Lower limit of normal). Severity is defined by comparing FEV1 (post bronchodilator) to predicted normal values.**

# COPD 'Value' Pyramid

## What we know so far.... Cost/QALY

ALL patients should have:

- **Intensive Smoking Cessation Advice**
- **Annual Flu Vaccination**
- **Inhaler Technique monitoring**
- **Personalised Patient Management Plan- especially patients prescribed a rescue pack**
- **Pulmonary rehabilitation if functionally limited by breathlessness and post discharge (NNT 3-6)**
- **Medications optimised not maximised**

Stopping smoking and flu vaccination are the most important interventions in COPD.

Drug group	Choice	Generic Name	Device	Brand name (for info only)	Further Information
SABA	1 <sup>st</sup>	Salbutamol	pMDI DPI -Easyhaler - Accuhaler		Nebulisers do not offer convincing advantages over MDIs given via a spacer device and are not routinely recommended.
	2 <sup>nd</sup>	Terbutaline	DPI -Turbohaler		
SAMA	1 <sup>st</sup>	Ipratropium	pMDI		Ipratropium can be used if SABA is ineffective. Give trial for one month and only continue if symptomatic relief.
LAMA Always stop SAMA if starting LAMA	1 <sup>st</sup>	Acclidinium	DPI - Genuair	Eklira	Twice daily administration. Once daily administration. LAMA is first line maintenance bronchodilator to improve breathlessness and reduce exacerbations.
	2 <sup>nd</sup>	Glycopyrronium	Inhalation powder capsule - Breezhaler	Seebri	
		Tiotropium	Inhalation powder capsule pMDI - (Respimat®)		
LABA	1 <sup>st</sup>	Formoterol	DPI - Easyhaler - Turbohaler		LABA can be added to LAMA if FEV1>50% and symptoms not fully controlled or used to replace LAMA if LAMA is ineffective.
	2 <sup>nd</sup>	Salmeterol	pMDI		
		Indacaterol	Inhalation powder capsule - Breezhaler	Onbrez	
LABA +LAMA	1 <sup>st</sup>	Glycopyrronium/ Indacaterol	Inhalation powder capsule - Breezhaler	Ultibro	For patients stabilised on constituent drugs
LABA + ICS	1 <sup>st</sup>	Beclometasone +Formoterol	pMDI	Fostair	If FEV1<50% or frequent exacerbations then consider ICS/LABA combination to help reduce exacerbation frequency. Fostair is an extrafine particle and therefore is more potent, Beclometasone dose 100 micrograms in Fostair is equivalent to 250 micrograms in Glenil Modulite.
	2 <sup>nd</sup>	Fluticasone furoate + vilanterol	DPI	Relvar Ellipta	Only fluticasone furoate 92 microgram/ vilanterol 22 microgram, licensed for use in COPD (both strengths licensed for asthma). (92mcg FF equivalent to 500mcg fluticasone propionate or 1000mcg CFC beclometasone)
		Budesonide/formoterol		DuoResp	160/4.5mcg equivalent to metered dose of 200mcg/6mcg 320/9mcg equivalent to metered dose 400/12mcg
Triple Therapy LAMA+LABA+ICS	Little evidence that triple therapy is any better than double therapy (DTB 20120:48(7):74) but may be worth a trial before oral therapy.				
Mucolytics	1st	Carbocisteine	May reduce sputum viscosity and reduce exacerbations in patients with chronic cough but stop if no benefit after 4 week trial. Not to be used for acute exacerbations.		
Rescue Packs for patients with FEV1<30% or frequent admissions or exacerbations	1st	Prednisolone 5mg 6 daily for 7 days ± Doxycycline 100mg OD or Amoxicillin 500mg TDS for 7 days	Patients should have personalised plans enabling them to initiate at home before seeing a GP or nurse in the practice. Frequent packs should prompt a review.
